

Moijul Islam

Software Engineer with a proven track record of taking end-to-end ownership of multiple B2B SaaS platforms.

Gloucester, UK (open to relocate) | moijul.dev@gmail.com | +44 7440 070340 | linkedin.com/in/md-moijul | md-moijul.github.io

Work Experience

Founder / Product Engineer — NUAA — Gloucester, UK

Jun 2026 – Present

An AI-powered sports analytics platform combining edge-based computer vision with intuitive workout tracking for elite sports clubs.

- Ran customer discovery with commercial gym owners and S&C coaches, defining the core biomechanical data points required to engineer a frictionless, sensor-free tracking system.
- Defined the architecture for a zero-retention edge-compute pipeline, ensuring the platform processes data locally to guarantee strict GDPR compliance.
- Mapped the core physics and kinematic requirements for the MVP, planning a scalable system designed for precise, real-time tracking during live field testing.
- Secured backing from the NatWest Accelerator and Gloucester Hub Incubator to refine our B2B sales strategy and prepare for early pilot rollouts.

Software Engineer — WILXITE — Stroud, UK

Sep 2022 – Apr 2026

Compliance Platform

A B2B compliance platform processing multi-step audit workflows, driven by a robust, white-labeled **Next.js** architecture.

- Took full technical ownership of frontend architecture, engineering and deploying reusable **React** components to internal Kubernetes clusters via Docker pipelines.
- Conducted client meetings to define project epics, translating business requirements into actionable engineering stories and negotiating sprint scope to ensure predictable delivery.
- Managed a large-scale **Next.js** monorepo using Lerna, enforcing strict separation of concerns and synchronized versioning between proprietary Core Logic packages and the Host Application.
- Led the transition to Trunk-Based Development by implementing feature flags, decoupling code deployment from feature release and eliminating over 80% of staging environment merge conflicts.
- Maintained and extended a custom Dependency Injection architecture, applying Object-Oriented design principles to enable rapid deployment of secure, white-label features.
- Accelerated feature delivery by working across the full stack, contributing API updates and bug fixes to the underlying Golang backend services to unblock frontend tasks when backend resources were constrained.
- Identified a critical cross-session authentication vulnerability where persistent cookies could be hijacked on shared devices, successfully coordinating with the internal auth team to patch the exploit.

Real Estate CMS Platform

A multi-tenant platform powering three corporate brands from a single **Next.js** codebase

- Engineered a scalable multi-tenant frontend architecture powering three major real estate brands from a single **Next.js** codebase, significantly reducing cross-brand maintenance overhead.
- Architected a 'URL-First' filtering system using **Next.js** Server Components to synchronize complex search criteria, reducing 'No Results' bounce rates by 35% via shareable, pre-filtered links.
- Developed a high-performance geospatial visualization interface integrating supercluster and Google Maps APIs, rendering 1000+ property markers with <200ms interaction latency.
- Built a central orchestrator component leveraging **React Context** to securely bridge headless CMS data, the map visualization, and the dynamic filtering UI into a unified state tree.

Drag and Drop Email builder

A complex drag-and-drop email builder for a marketing SaaS, featuring a **React** engine that compiles responsive HTML.

- Architected a standalone **React** package utilizing a recursive OOP Node structure to support deeply nested drag-and-drop layouts.
- Engineered a high-performance rendering engine with **Zustand** and **React.memo**, bridging a mutable Class-based state tree to maintain 60fps.
- Implemented a robust data-transformation pipeline with **React-Email**, compiling the JSON AST state directly into email-safe HTML.
- Maintained 90%+ **test** coverage on core drag logic using Cypress Component Testing, ensuring continuous high-quality delivery and stable **CI/CD** pipelines.

Wearable IMU Trajectory Analyzer

An R&D project that translates noisy Arduino IMU sensor data into accurate 3D trajectories using advanced **Python** filtering algorithms and a dynamic **Next.js** UI.

- Set up a distributed IoT pipeline that separated **Node.js** hardware sensor ingestion from **Python** mathematical processing to prevent data loss.
- Utilized Claude and Gemini CLI to rapidly prototype a **React Native** data-gathering application, significantly accelerating the delivery of the hardware integration layer.
- Designed a dynamic REST API utilizing **FastAPI** and **Pydantic**, serving JSON schemas to the **Next.js** frontend to power a Server-Driven UI that automatically renders configuration controls.
- Solved critical accelerometer double-integration drift by prototyping Extended Kalman Filters (EKF) in **Python**.

Warehouse Order Picking System

An offline-resilient Progressive Web App (PWA) built with **Next.js**, engineered with LocalStorage persistence and hardware barcode integration.

- Owned the end-to-end development of a **Next.js** warehouse application from zero to MVP as the sole frontend engineer, establishing strict **TypeScript** standards and **React** best practices to ensure a seamless codebase handover for long-term maintenance.
- Designed a "Hard Persistence" state layer via LocalStorage to prevent critical data loss during device sleep cycles and Wi-Fi dead zones.
- Integrated hardware keyboard-emulated barcode scanners directly into the **React** component lifecycle via global event listeners, significantly reducing manual data entry errors.

Skills

Languages:	TypeScript · JavaScript (ES6+) · Python · Golang · Kotlin · C/C++ · SQL · HTML/CSS
Frontend Ecosystem:	React · Next.js · Vue 3 · Tailwind CSS · Axios · Shadcn/UI · Zustand · Storybook · Zod
Backend & Databases:	Node.js · Django · FastAPI · PostgreSQL · MongoDB · REST APIs
DevOps, Testing & Tools:	Docker · Kubernetes · CI/CD · Lerna / Nx · Vite · Feature Flags · TDD · Cypress · Vitest
AI & Orchestration:	Claude · Gemini API · LangChain · Antigravity · Aider · Cursor

Education

BSc (Hons) Computer Science (with Industrial Placement) — **First Class**

Sep 2020 – Jun 2024

University of the West of England, Bristol

- Served as Vice President of the UWEFOP Students Society, successfully navigating complex university compliance frameworks to organize and execute multiple large-scale educational events.
- Built a secure, distributed web platform using **Django** to serve and execute AI models, leading the Agile implementation of strict Role-Based Access Control.
- Programmed an autonomous, self-driving robot in **C++** using an Arduino microcontroller, integrating sensor fusion algorithms for real-time obstacle avoidance.
